Experiment No. 3

Apply Decision Tree Algorithm on Adult Census Income

Dataset and analyze the performance of the model

Date of Performance:

Date of Submission:

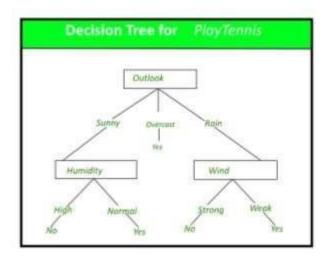

Department of Computer Engineering

Aim: Apply Decision Tree Algorithm on Adult Census Income Dataset and analyze the performance of the model.

Objective: To perform various feature engineering tasks, apply Decision Tree Algorithm on the given dataset and maximize the accuracy, Precision, Recall, F1 score. Improve the performance by performing different data engineering and feature engineering tasks.

Theory:

Decision Tree is the most powerful and popular tool for classification and prediction. A Decision tree is a flowchart-like tree structure, where each internal node denotes a test on an attribute, each branch represents an outcome of the test, and each leaf node (terminal node) holds a class label.

Dataset:

Predict whether income exceeds \$50K/yr based on census data. Also known as "Adult" dataset.

Attribute Information:

Department of Computer Engineering

Listing of attributes:

>50K, <=50K.

age: continuous.

workclass: Private, Self-emp-not-inc, Self-emp-inc, Federal-gov, Local-gov,

State-gov, Without-pay, Never-worked.

fnlwgt: continuous.

education: Bachelors, Some-college, 11th, HS-grad, Prof-school, Assoc-acdm,

Assoc-voc, 9th, 7th-8th, 12th, Masters, 1st-4th, 10th, Doctorate, 5th-6th,

Preschool.

education-num: continuous.

marital-status: Married-civ-spouse, Divorced, Never-married, Separated,

Widowed, Married-spouse-absent, Married-AF-spouse.

occupation: Tech-support, Craft-repair, Other-service, Sales, Exec-managerial,

Prof-specialty, Handlers-cleaners, Machine-op-inspet, Adm-clerical, Farming-

fishing, Transport-moving, Priv-house-serv, Protective-serv, Armed-Forces.

relationship: Wife, Own-child, Husband, Not-in-family, Other-relative,

Unmarried.

race: White, Asian-Pac-Islander, Amer-Indian-Eskimo, Other, Black.

sex: Female, Male.

Department of Computer Engineering

capital-gain: continuous.

capital-loss: continuous.

hours-per-week: continuous.

native-country: United-States, Cambodia, England, Puerto-Rico, Canada, Germany, Outlying-US(Guam-USVI-etc), India, Japan, Greece, South, China, Cuba, Iran, Honduras, Philippines, Italy, Poland, Jamaica, Vietnam, Mexico, Portugal, Ireland, France, Dominican-Republic, Laos, Ecuador, Taiwan, Haiti, Columbia, Hungary, Guatemala, Nicaragua, Scotland, Thailand, Yugoslavia, El-Salvador, Trinadad&Tobago, Peru, Hong, Holand-Netherlands.

Conclusion:

- 1. How categorical attributes have been dealt with during data pre-processing?
- ➤ Since those models (being mathematical equations) can process only numeric variables. Categorical values can't be directly used. We need to encode the categorical variables into a standard format so that sklearn can understand them and build the tree. Hence we would do that using the LabelEncoder() class, which comes with sklearn.preprocessing.
- 2. Hyper-Parameter tunning done based on the decision tree.
- ➤ Hyperparameter tuning (or hyperparameter optimization) is the process of determining the right combination of hyperparameters that maximizes the model performance. It works by running multiple trials in a single training process. In this implementation it done on max_depth, min_samples_leaf and min_samples_split.
 - 3. Accuracy, confusion matrix, precision, recall and F1 score obtained.
