Experiment No. 4
Apply Random Forest Algorithm on Adult Census Income Dataset and analyze the performance of the model
Date of Performance:
Date of Submission:

Aim: Apply Random Forest Algorithm on Adult Census Income Dataset and analyze the performance of the model.

Objective: Able to perform various feature engineering tasks, apply Random Forest Algorithm on the given dataset and maximize the accuracy, Precision, Recall, F1 score.

Theory:

Random Forest is a popular machine learning algorithm that belongs to the supervised learning technique. It can be used for both Classification and Regression problems in ML. It is based on the concept of ensemble learning, which is a process of combining multiple classifiers to solve a complex problem and to improve the performance of the model.

As the name suggests, "Random Forest is a classifier that contains a number of decision trees on various subsets of the given dataset and takes the average to improve the predictive accuracy of that dataset." Instead of relying on one decision tree, the random forest takes the prediction from each tree and based on the majority votes of predictions, and it predicts the final output.

The greater number of trees in the forest leads to higher accuracy and prevents the problem of overfitting.

The below diagram explains the working of the Random Forest algorithm:
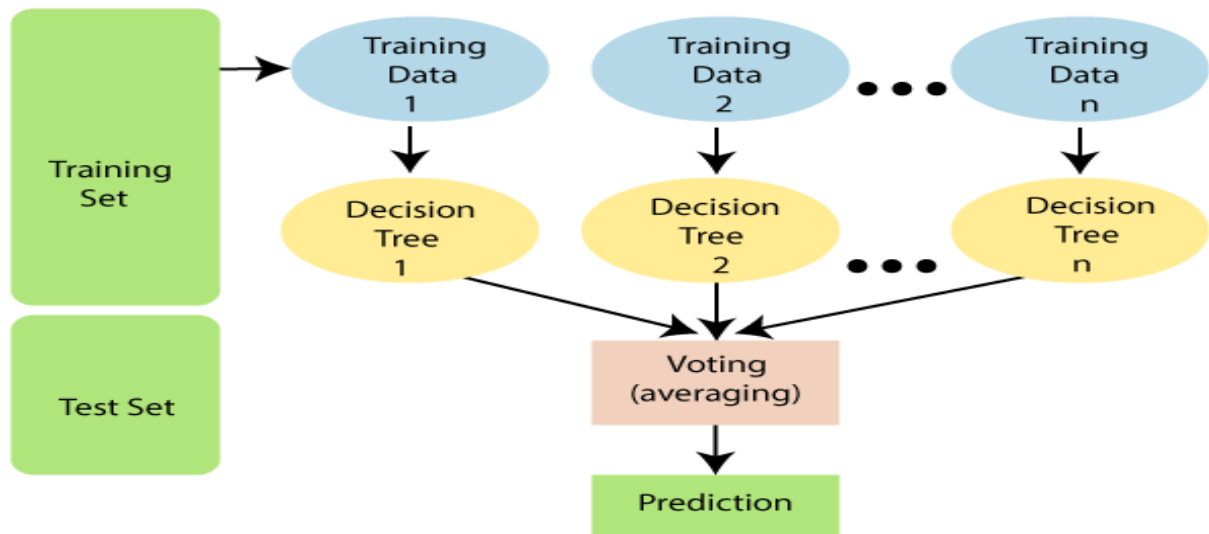

Dataset:

Predict whether income exceeds $50K/yr based on census data. Also known as "Adult" dataset.

Attribute Information:
Listing of attributes:
>50K, <=50K.
age: continuous.

workclass: Private, Self-emp-not-inc, Self-emp-inc, Federal-gov, Local-gov, State-gov, Without-pay, Never-worked.

fnlwgt: continuous.

education: Bachelors, Some-college, 11th, HS-grad, Prof-school, Assoc-acdm, Assoc-voc, 9th, 7th-8th, 12th, Masters, 1st-4th, 10th, Doctorate, 5th-6th, Preschool.

education-num: continuous.

marital-status: Married-civ-spouse, Divorced, Never-married, Separated, Widowed, Married-spouse-absent, Married-AF-spouse.

occupation: Tech-support, Craft-repair, Other-service, Sales, Exec-managerial, Prof-specialty, Handlers-cleaners, Machine-op-inspct, Adm-clerical, Farming-fishing, Transport-moving, Priv-house-serv, Protective-serv, Armed-Forces.
relationship: Wife, Own-child, Husband, Not-in-family, Other-relative, Unmarried.

race: White, Asian-Pac-Islander, Amer-Indian-Eskimo, Other, Black.

sex: Female, Male. capital-gain: continuous. capital-loss: continuous.

hours-per-week: continuous.

native-country: United-States, Cambodia, England, Puerto-Rico, Canada, Germany, Outlying-US(Guam-USVI-etc), India, Japan, Greece, South, China, Cuba, Iran, Honduras, Philippines, Italy, Poland, Jamaica, Vietnam, Mexico, Portugal, Ireland, France, Dominican-Republic, Laos, Ecuador, Taiwan, Haiti, Columbia, Hungary, Guatemala, Nicaragua, Scotland, Thailand, Yugoslavia, El-Salvador, Trinadad &Tobago, Peru, Hong, Holand-Netherlands.

Code:

```
import pandas as pd import

3	54	Private	140359	7th-8th	4	Divorced	Machine-op-inspct	Unmarried	White	Female	0	3900	40
4	41	Private	264663	Some-college	10	Separated	Prof-specialty	Own-child	White	Female	0	3900	40

```
dataset = dataset[(dataset != '?').all(axis=1)]
dataset['income']=dataset['income'].map({'<=50K': 0, '>50K': 1})
sns.catplot(x='education.num',y='income',data=dataset,kind='bar',height=6) plt.show()
```

```
sns.catplot(x='marital.status',y='income',data=dataset,kind='bar',height=8)
plt.show()
```
sns.catplot(x='relationship',y='income',data=dataset,kind='bar',size=7) plt.show()
```python
dataset['marital.status']=dataset['marital.status'].map({'Married-civ-
spouse':'Married', 'Divorced':'Single', 'Never-married':'Single',
'Separated':'Single','Widowed':'Single', 'Married-spouse-absent':'Married',
'Married-AF-spouse':'Married'})

for column in dataset:

  enc=LabelEncoder()                if

  dataset.dtypes[column]==np.object:

  dataset[column]=enc.fit_transform(da

  taset[column])
```
```
plt.figure(figsize=(14,10))

sns.heatmap(dataset.corr(),annot=Tru

e,fmt='.2f') plt.show()
```

```
dataset=dataset.drop(['relationship','education'],axis=1)

dataset=dataset.drop(['occupation','fnlwgt','native.country'],axis=1)

X=dataset.iloc[:,0:-1] y=dataset.iloc[:,-1]

x_train,x_test,y_train,y_test=train_test_split(X,y,test_size=0.33,shuffle=False
```

```
) clf=RandomForestClassifier(n_estimators=100)

cv_res=cross_val_score(clf,x_train,y_train,cv=10)

clf=RandomForestClassifier(n_estimators=50,max_features=5,min_samples_leaf=50)

clf.fit(x_train,y_train) pred=clf.predict(x_test)

print("Accuracy: %f " % (100*accuracy_score(y_test,

pred)))
```

Accuracy: 85.011051

Conclusion:

1. State the observations about the data set from the correlation heat map.

➤ For Adult Census Income Dataset from the heatmap "education" and "education.num" are highly correlated, same can be said about the "marital.status" and "relationship" thus, we can drop "relationship" and "education".

2. Accuracy, confusion matrix, precision, recall and F1 score obtained.

```
Accuracy: 85.011051
              precision    recall  f1-score   support

           0       0.87      0.95      0.91      7942
           1       0.70      0.45      0.55      2012

   micro avg       0.85      0.85      0.85      9954
   macro avg       0.79      0.70      0.73      9954
weighted avg       0.84      0.85      0.84      9954
```

3. Compare the results obtained by applying random forest and decision tree algorithm on the Adult Census Income Dataset.

➤ Generally the Random Forest Algorithm is more accurate than Decision Tree Algorithm but, by tunning hyper-parameters and determining the right combinations of parameters in Decision Tree we are the to achieve the accuracy of nearly 84 which is extremely close to Random Forest accuracy:(85.01) in Adult Census Income Dataset.
